

Coco App — Build Roadmap

What Version 1 generates vs what needs to be added next

■ What Version 1 Builds Successfully

- UI screens and navigation (Home, Saved, Notifications, Profile)
- Basic deal crawling from listed Nigerian sources
- Community upvote/downvote and Still Works/Expired system
- Paywall modal after 10 deal opens
- Category tabs — Telecoms, Food, Supermarkets, Electronics etc
- Glassmorphism dark design throughout
- Quality score calculation logic (0-100)
- Push notification setup via Expo
- Seed data with 20 realistic Nigerian deals
- Brand reliability tracking foundation

■ ■ What Will Be Missing or Weak After V1

Data & Intelligence

- Price history flat on day one — needs weeks of crawling before "43% cheaper than 30-day average" is meaningful
- Personalisation engine needs real user behaviour — day one feed is essentially random
- Brand reliability scores empty until enough deals tracked per brand
- Twitter/X crawling for Chowdeck will likely fail — X blocks scrapers aggressively

Crawlers Specifically

- Most Nigerian brand sites are JavaScript-rendered — basic crawlers will get empty pages
- Jumia and Konga have anti-scraping protection
- Shoprite Nigeria website structure changes frequently
- Need Puppeteer (headless browser) not basic HTTP requests for most sites

Business & Monetisation

- No actual payment integration — paywall modal exists but no way to collect ₦2,000/month. Needs Paystack
- No user accounts — if app deleted, personalisation resets completely
- No admin dashboard — no visibility into users, deals, or crawl health

Nigerian-Specific Gaps

- No location-aware deals — Shoprite Ibadan vs Shoprite Lagos
- No WhatsApp share button — Nigerians share everything via WhatsApp
- No public holiday deal predictions — Sallah, Christmas, Easter alerts
- No Naira price formatting in some places

■ Priority Order — What To Add After V1 Is Working

1	Paystack Payment Integration	Without this you cannot collect ₦2,000/month. No money = no business. Add Paystack checkout for Coco Pro subscription.
2	User Accounts	Without accounts, personalisation and Pro status reset if app is deleted. Add email/phone login so user data persists on backend.
3	Puppeteer-Based Crawlers	Most Nigerian brand sites are JS-rendered. Basic HTTP crawlers return empty pages. Puppeteer runs a real browser and gets the actual content.
4	WhatsApp Share Button	High impact, low effort. Nigerians share everything on WhatsApp. One tap to share a deal to WhatsApp contact or group.
5	Location-Aware Deals	Show Shoprite Ibadan deals to Ibadan users, Shoprite Lagos deals to Lagos users. Requires user to set their city in profile.

6	Admin Dashboard	Web dashboard showing: active deals, crawl health, user count, top deals, expired deals to remove manually if needed.
7	Referral System	Invite a friend, get 1 month Coco Pro free. Friend joins, you both benefit. Classic growth mechanic that costs nothing.
8	Product-Specific Alerts	User says "notify me when iPhone 15 goes on sale on Jumia" — targeted alerts for specific products, not just categories.
9	Weekly Digest	Every Sunday morning — "Best 5 deals of the week" push notification. Retention mechanic to keep users engaged.
10	Deal Prediction Engine	Most defensible long-term feature. Predict when brands will run deals based on historical patterns. "Sallah is in 2 weeks — expect MTN double data offers."

■ Critical (do first)

■ Important (do second)

■ Growth (do third)

■ Moat (long term)
